

Class 16: RNA-Seq Mini Project

Jasmine Lee (PID: A15583527)

11/18/2021

Background

The data for for hands-on session comes from GEO entry: GSE37704, which is associated with the following publication: > Trapnell C, Hendrickson DG, Sauvageau M, Goff L et al. “Differential analysis of gene regulation at transcript resolution with RNA-seq”. Nat Biotechnol 2013 Jan;31(1):46-53. PMID: 23222703

The authors report on differential analysis of lung fibroblasts in response to loss of the developmental transcription factor HOXA1. Their results and others indicate that HOXA1 is required for lung fibroblast and HeLa cell cycle progression. In particular their analysis show that “loss of HOXA1 results in significant expression level changes in thousands of individual transcripts, along with isoform switching events in key regulators of the cell cycle”. For our session we have used their Sailfish gene-level estimated counts and hence are restricted to protein-coding genes only.

Data Import

Q1. Complete the code below to remove the troublesome first column from countData.

Answer:

```
# Note we need to remove the odd first $length col
countData <- as.matrix(countData[,-1])
head(countData)
```

```
##                SRR493366 SRR493367 SRR493368 SRR493369 SRR493370 SRR493371
## ENSG00000186092         0         0         0         0         0         0
## ENSG00000279928         0         0         0         0         0         0
## ENSG00000279457        23        28        29        29        28        46

```

Q2. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns). (Tip: What will **rowSums()** of countData return and how could you use it in this context?)

Answer:

```
# Filter count data where you have 0 read count across all samples.
countData = countData[rowSums(countData) > 0, ]
head(countData)
```

```
##                SRR493366 SRR493367 SRR493368 SRR493369 SRR493370 SRR493371
## ENSG00000279457        23        28        29        29        28        46
## ENSG00000187634       124       123       205       207       212       258

```

Get results from HoxA1 knockdown vs. control siRNA.

```
res <- results(dds, contrast=c("condition", "hoxa1_kd", "control_siRNA"))
```

Q3. Call the `summary()` function on your results to get a sense of how many genes are up or downregulated at the default 0.1 p-value cutoff.

Answer:

```
summary(res)
```

```
##
## out of 15975 with nonzero total read count
## adjusted p-value < 0.1
## LFC > 0 (up)      : 4349, 27%
## LFC < 0 (down)    : 4396, 28%
## outliers [1]      : 0, 0%
## low counts [2]    : 1237, 7.7%
## (mean count < 0)
## [1] see 'cooksCutoff' argument of ?results
## [2] see 'independentFiltering' argument of ?results
```

Volcano Plot

```
plot(res$log2FoldChange, -log(res$padj))
```

Q4. Improve this plot by completing the below code, which adds color and axis labels.

Answer:

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res))

# Color red the genes with absolute fold change above 2
mycols[abs(res$log2FoldChange) > 2] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2)
mycols[inds] <- "blue"

plot(res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(P-value)" )
```

Adding Gene Annotation

Q5. Use the `mapIds()` function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

Answer:

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

```
##
```

```
columns(org.Hs.eg.db)
```

```
## [1] "ACCNUM"      "ALIAS"       "ENSEMBL"     "ENSEMBLPROT" "ENSEMBLTRANS"
## [6] "ENTREZID"    "ENZYME"      "EVIDENCE"    "EVIDENCEALL"  "GENENAME"
## [11] "GENETYPE"    "GO"          "GOALL"       "IPI"          "MAP"
## [16] "OMIM"        "ONTOLOGY"    "ONTOLOGYALL" "PATH"         "PFAM"
## [21] "PMID"        "PROSITE"     "REFSEQ"      "SYMBOL"       "UCSCKG"
## [26] "UNIPROT"
```

```
res$symbol = mapIds(org.Hs.eg.db,
  keys=row.names(res),
  keytype="ENSEMBL",
  column="SYMBOL",
  multiVals="first")
```

```
## 'select()' returned 1:many mapping between keys and columns
```

```
res$entrez = mapIds(org.Hs.eg.db,
  keys=row.names(res),
  keytype="ENSEMBL",
  column="ENTREZID",
  multiVals="first")
```

```
## 'select()' returned 1:many mapping between keys and columns
```

```
res$name = mapIds(org.Hs.eg.db,
  keys=row.names(res),
  keytype="ENSEMBL",
  column="GENENAME",
  multiVals="first")
```

```
## 'select()' returned 1:many mapping between keys and columns
```

```
head(res, 10)
```

```
## log2 fold change (MLE): condition hoxa1_kd vs control_sirna
```

```
## Wald test p-value: condition hoxa1 kd vs control sirna
```

```
## DataFrame with 10 rows and 9 columns
```

```
##           baseMean log2FoldChange      lfcSE      stat      pvalue
##           <numeric>      <numeric> <numeric> <numeric> <numeric>

```

Q6. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res <- res[order(res$pvalue), ]
write.csv(res, file="deseq_results.csv")
```

Pathway Analysis

Now we can load the three packages and set up the KEGG datasets we need.

```
library(pathview)
```

```
## #####
## Pathview is an open source software package distributed under GNU General
## Public License version 3 (GPLv3). Details of GPLv3 is available at
## http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to
## formally cite the original Pathview paper (not just mention it) in publications
## or products. For details, do citation("pathview") within R.
##
## The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG
## license agreement (details at http://www.kegg.jp/kegg/legal.html).
## #####
```

```
library(gage)
```

```
##
```

```
library(gageData)
```

```
data(kegg.sets.hs)
data(sigmet.idx.hs)
```

```
# Focus on signaling and metabolic pathways only
kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
```

```
# Examine the first 3 pathways
head(kegg.sets.hs, 3)
```

```

```

Now let's run the **gage** pathway analysis.

```
# Get the results
keggres <- gage(foldchanges, gsets=kegg.sets.hs)
```

Let's look at the object returned from **gage()**.

```
attributes(keggres)
```

```
## $names
## [1] "greater" "less" "stats"
```

Let's look at the first few downregulated (less) pathways.

```
head(keggres$less)
```

```
##                p.geomean stat.mean          p.val

```

Let's try out the 'pathview()' function from the **pathview** package to make a pathway plot with our RNA-Seq expression results shown in color.

```
pathview(gene.data=foldchanges, pathway.id="hsa04110")
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```
## Info: Writing image file hsa04110.pathview.png
```

Now, let's process our results a bit more to automatically pull out the top 5 upregulated pathways, then further process that just to get the pathway IDs needed by the **pathview()** function.

```
# Focus on top 5 upregulated pathways here for demo purposes only
```

```
keggrespathways <- rownames(keggres$greater)[1:5]
```

```
# Extract the 8 character long IDs part of each string
```

```
keggresids = substr(keggrespathways, start=1, stop=8)
```

```
keggresids
```

```
## [1] "hsa04640" "hsa04630" "hsa00140" "hsa04142" "hsa04330"
```

Now let's pass these IDs in keggresids to the **pathview()** function to draw plots for all the top 5 pathways.

```
pathview(gene.data=foldchanges, pathway.id=keggresids, species="hsa")
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```
## Info: Writing image file hsa04640.pathview.png
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```
## Info: Writing image file hsa04630.pathview.png
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```

```

```
## Info: Writing image file hsa04142.pathview.png
```

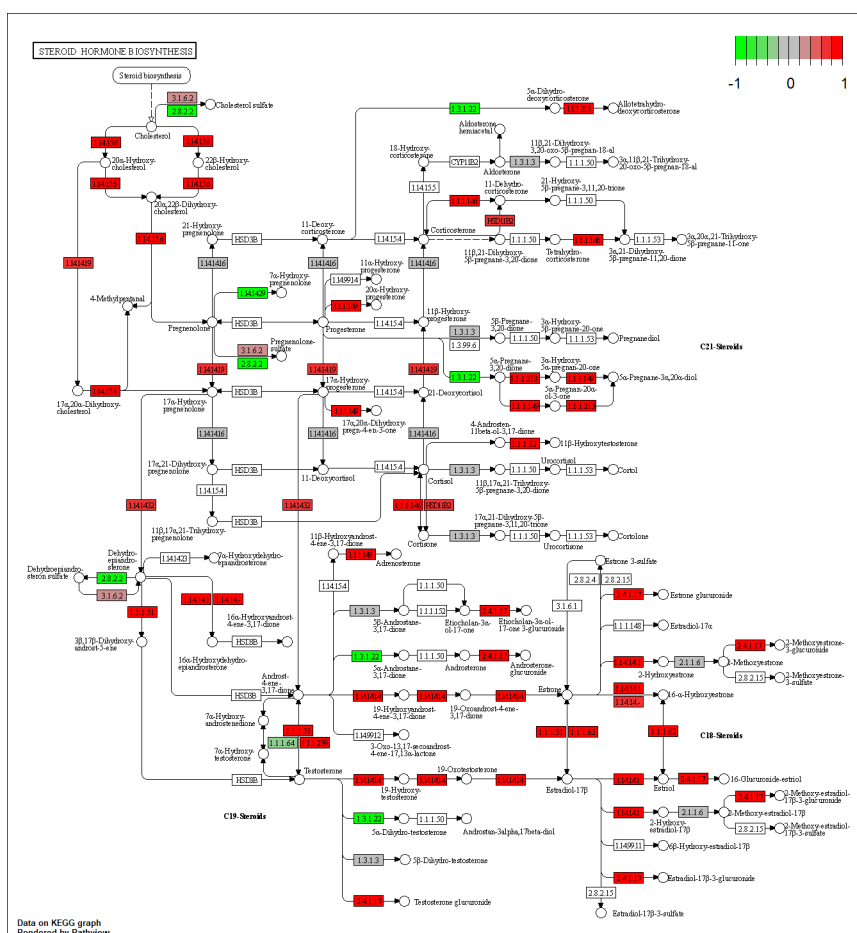

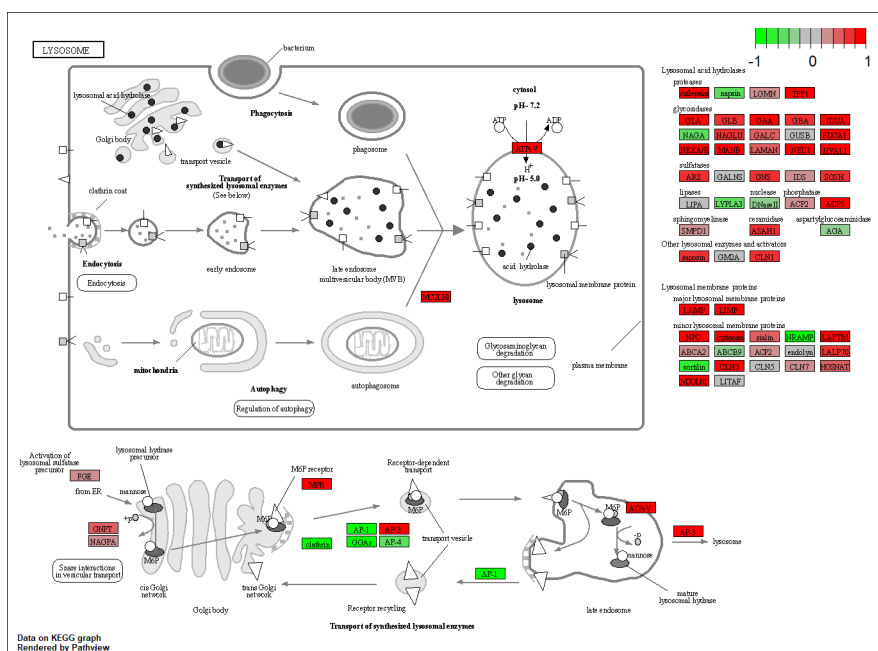

```
## Info: some node width is different from others, and hence adjusted!
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```
## Info: Writing image file hsa04330.pathview.png
```

Q7. Can you do the same procedure as above to plot the pathview figures for the top 5 down-regulated pathways?

Answer:

```
# Focus on top 5 upregulated pathways here for demo purposes only
```

```
keggrespathways2 <- rownames(keggres$less)[1:5]
```

```
# Extract the 8 character long IDs part of each string
```

```
keggresidsless = substr(keggrespathways2, start=1, stop=8)
```

```
keggresidsless
```

```
## [1] "hsa04110" "hsa03030" "hsa03013" "hsa03440" "hsa04114"
```

```
pathview(gene.data=foldchanges, pathway.id=keggresidsless, species="hsa")
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```
## Info: Writing image file hsa04110.pathview.png
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```

```

```
## Info: Working in directory C:/Users/jasmi/OneDrive/Documents/UCSD Fall 2021/BIMM 143/BIMM143_github/
```

```
## Info: Writing image file hsa03440.pathview.png
```

Gene Ontology (GO)

We can also do a similar procedure with gene ontology. Similar to above, **go.sets.hs** has all GO terms. **go.subs.hs** is a named list containing indexes for the BP, CC, and MF ontologies. Let's focus on BP (a.k.a Biological Process) here.

```
data(go.sets.hs)
data(go.subs.hs)

# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]

gobpres = gage(foldchanges, gsets=gobpsets, same.dir=TRUE)

lapply(gobpres, head)
```

```

Reactome Analysis

Using R, output the list of significant genes at the 0.05 level as a plain text file.

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))
```

```
## [1] "Total number of significant genes: 8147"
```

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quote=FALSE)
```

Q8. What pathway has the most significant “Entities p-value”? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Answer: The endosomal/vacuolar pathway has the most significant “Entities p-value” of 8.59E-4. The most significant pathways slightly differ from my previous KEGG results. The different extent of pathways documented in KEGG and Reactome could cause differences between the two methods. Moreover, the varying screening parameters of the two methods may contribute to differences.
